

Edge weights: attention share of the two halves of a factor inside the same outgoing message, last iteration (59312 pairs)

The same shares as histograms (fully overlapping bars = identical halves)

The pair whose shares drifted apart the most (50 nodes, seed 0, x2 to f225, halves of f246; solid = half A, dashed = half B)

Share of half A against half B over the run, messages with 49 incoming neighbors (8400 of 59312 pairs, 50 nodes, seed 0)
