

Edge weights: attention share of the two halves of a factor inside the same outgoing message, last iteration (7280 pairs)

The same shares as histograms (fully overlapping bars = identical halves)

The pair whose shares drifted apart the most (seed 0, x9 to f29, halves of f79; solid = half A, dashed = half B)

Share of half A against half B over the run, messages with 7 incoming neighbors (2208 of 7280 pairs, 50 seeds; a seed drops out once its run stops)
